Analyse Various Types of Servers using Webalizer tool.

Aim:

To analyse web server log files using the webalizer tool and generate statistical reports about web traffic and server activity

Algorithm/procedure:

1. Install the webalizer tool on a compatible system
2. obtain the access log files generated by a web server, such as Apache or a compatible server.
3. Configure webalizer with the correct log-file path, report output directory, and log format.
4. Execute webalizer on the selected web server log file.
5. Allow the tool to process the log entries and generate statistical reports.
6. Open the generated HTML report in a web browser.
7. Examine statistics such as total requests, successful requests, page views, unique visitors, and data transferred.

Command prompt

webalizer /var/log/apache2/access.log

Sample output:

webalizer V2.23

Generating report...

Total Requests : 1500

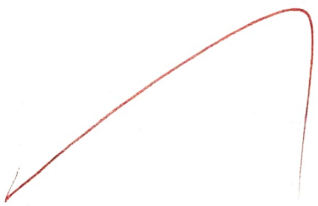

Successful requests : 1450

Page views : 800

unique visitors : 250

Data Transfered : 25 MB

Report generated successfully.

8. Analyse the monthly and daily traffic summaries and identify usage patterns.

9. Repeat the analysis for other available web server logs, if required.

10. Compare the generated reports and record the observations.

Result:

Webalizer was used successfully to analyze web server log files and generate reports showing server requests, visitor activity, page views and data transfer statistics.
